For stained teeth, where the professional oral cleaning doesn't give the desired results, we offer the possibility of teeth bleaching (whitening).

Bleaching of only one piece of a very stained canine (front lateral tooth) before and after treatment.

The gel takes some days to work.

But this method can only be used in teeth that retain the root.

For home bleaching we prepare for you a plastic splint which is filled with gel and can be applied at home 2 or 3 hours a day for two weeks.

The oxygen released by the gel whitens the teeth.
